

The new Mirage Rx

Our new Mirage Rx scope stand assembly combines the proven base design of our original Mirage Rx with our new fully adjustable boom. This unit features our original “boomerang” shaped ½” thick powder coated steel base.

By hanging the scope down from the scope mounting plate, you have full access for left port loading while also freeing up space on your shooting mat.

Azimuth, tilt, elevation and proximity to your rifle scope is all controlled with our adjustable friction points. Once these friction points are adjusted to hold your scopes weight your scope can be placed in perfect position with just one hand. This allows adjustment while in position behind your rifle scope. By bringing your eye piece to the perfect location relative to your rifle scope you can now view mirage without excessive head movement.

The horizontal booms overhanging from the vertical post can be locked down or left free to rotate. there is also an adjustable memory collar on the vertical post for returning the boom to your preset height. The vertical post is 24” tall. By adding a second post you can use the Mirage Rx for scoring targets from a seated or standing position. The preset height (via the locking memory collar) lets you rapidly return the scope to your previous prone setup.

Being able to instantly go from your mirage scope to your rifles scope is the goal. Time saved between verifying mirage to breaking your shot might save missing a switch when conditions get tough.

This kit comes with tools for adjustment of the friction points. The 6061T6 aluminum parts are all hard anodized for good looks and durability.
